## Tank Mix Guidelines

- Ensure sprayer tank is clean and free from residue of any previous products
- Half fill the sprayer before adding products.
- Allow time for one product to fully disperse before adding the next.
- Spray the mixture straight away and avoid leaving in the sprayer overnight.
- Check the inside of the sprayer tank for any residue after emptying each tank.
- The source and quality of water can have an impact on the physical compatibility of different chemicals
- If in doubt conduct a bucket test prior to filling the sprayer.

These tank mixes have been tested for physical compatibility at recommended rates of use and will mix with each other. No tests have been undertaken on crop safety, product performance or sprayer tank compatibility, therefore use is at the grower's own risk.

When using tank mixes always follow the statutory conditions of all tank mix partners. Use plant protection products safely. Always read the label and product information before use.

For further information on OMEX products and compatibilities, refer to [www.omex.co.uk](http://www.omex.co.uk) or contact OMEX Agriculture Ltd on 01553 760011.

\*Chlorizadon & Chlorizadon + Metamitron needs to be dissolved in 50-100L/Ha of water first and then the N or NS grades added. This will spray but should not be left for any extended period in the sprayer tank or its lines, as it reacts over time to form a precipitate that would be a problem

### Sugar Beet Recommendations

A single application of the total nitrogen requirement of the crop plus a herbicide can be applied immediately post drilling with Nitroflo Solo (OMEX Nitroflo 30N plus Didin) on **medium** soils up to a total of 120 kg/ha N. On sands and very light soils the single application **must be carried out at least 10 days before drilling** up to a maximum of 120 kg/ha N and can include Gallup Hi-Aktiv, useful in direct drilling situations on light land. For split nitrogen applications, the first application can be made with Nitroflo, including a pre-emergence herbicide and water. The main post-emergence dressing can be made with Nitroflo or Nitroflo-S, applied with streamer bars, after the 6-leaf stage.

### NK Compounds

British Sugar has suggested that an early top-dressing of a small amount of potash with the first nitrogen application may be useful to ensure good early growth. An application of 300 kg/ha (250 l/ha) of OMEX 16-0-8 is recommended, applied with a pre-emergence herbicide. 250 l/ha OMEX 16-0-8 will apply 48 kg/ha N and 24 kg/ha K<sub>2</sub>O
